

CAPIFLO DVT

Description

Elevate Your Health with CapiFlo: Your Defense Against DVT. By harnessing the power of an electronically controlled pump, CapiFlo aids in preventing Deep Vein Thrombosis (DVT) by expertly stimulating blood flow within your legs. This innovative technology delivers a precisely measured amount of air to specialized leg cuffs, delicately compressing the calves. This compression encourages optimal blood circulation, effectively aiding in the flow of blood out of the lower extremities. With each application, CapiFlo's pump inflates the leg cuffs to a carefully calibrated pressure of 50 mmHg, providing a therapeutic and rejuvenating compression. Once this pressure threshold is reached, the cuffs gently deflate, and the cycle continues. This intelligent process is seamlessly repeated on each unit, ensuring comprehensive care and treatment until you decide to power it off. The true marvel of CapiFlo lies in its effortless portability, thanks to internal rechargeable batteries. This means you can enjoy uninterrupted treatment wherever you go, eliminating any disruptions in your journey to better leg health. Experience the future of DVT prevention and leg wellness with CapiFlo."
